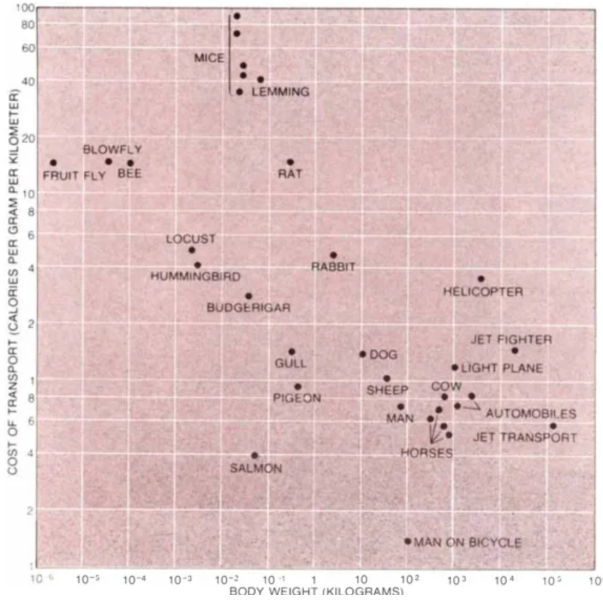
Language Models for Law and Social Science

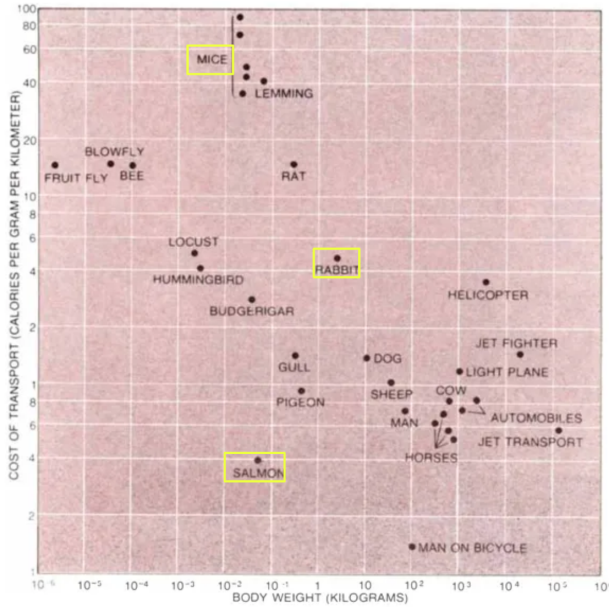
ETH Zurich, Spring 2025

1. Introduction

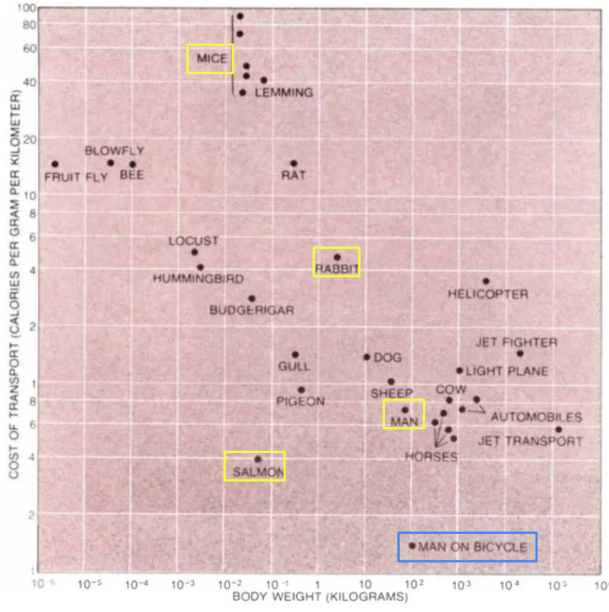


Scientific American, March 1973.

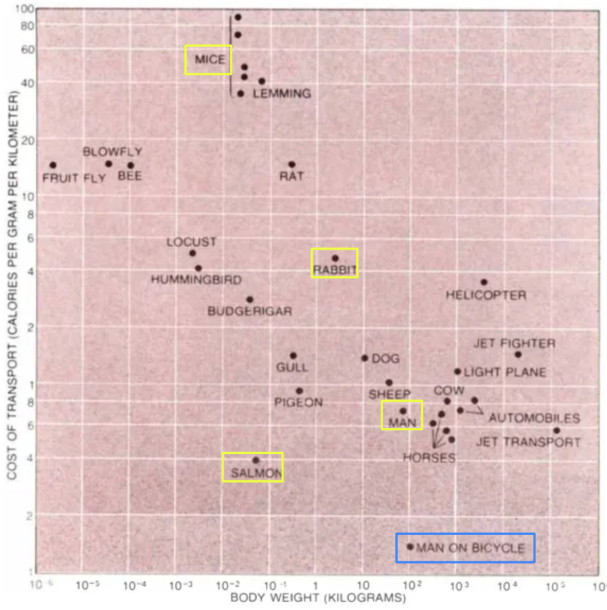
Hat tip: Sendhil Mullainathan



Scientific American, March 1973.



Scientific American, March 1973.



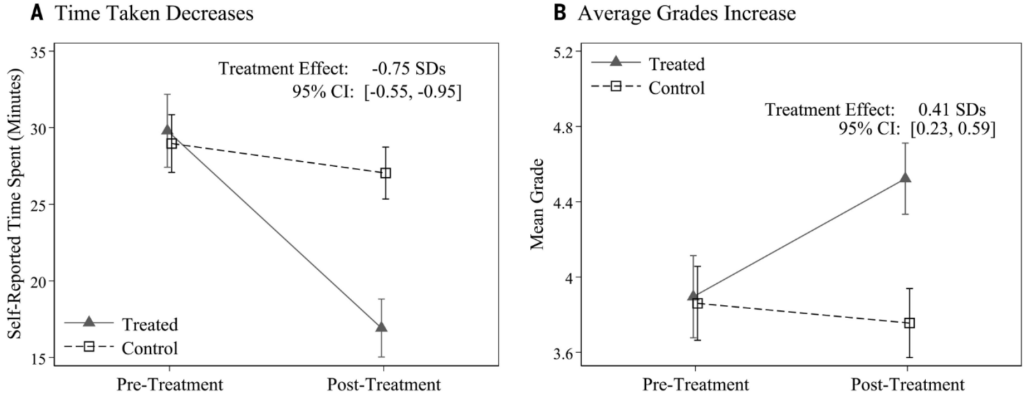
"And, a man on a bicycle, a human on a bicycle, blew the condor away, completely off the top of the charts.

And that's what a computer is to me. What a computer is to me is, it's the most remarkable tool that we've ever come up with, and it's the equivalent of a **bicycle for our minds**."

~ Steve Jobs

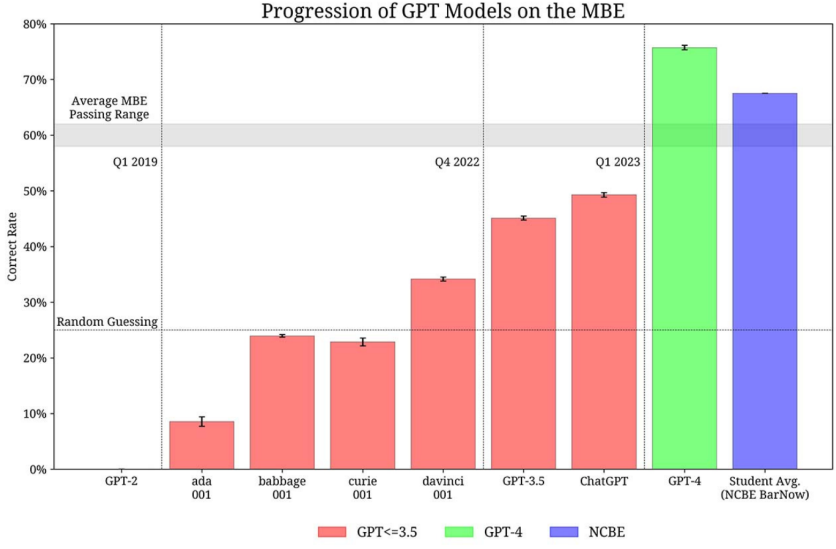
Language Models as Brain Bicycles

AI helps in professional writing tasks (Noy & Zhang 2023)



. . but other evidence is mixed (e.g. Dell'Acqua et al 2023; Cui et al 2024).

AI crushes the bar exam



… but AI still makes a lot of mistakes.

Air Canada must honor refund policy invented by airline's chatbot

Air Canada appears to have quietly killed its costly chatbot support.

ASHLEY BELANGER - 2/16/2024, 6:12 PM

On the day Jake Moffatt's grandmother died, Moffat immediately visited Air Canada's website to book a flight from Vancouver to Toronto. Unsure of how Air Canada's bereavement rates worked, Moffatt asked Air Canada's chatbot to explain.

The chatbot provided inaccurate information, encouraging Moffatt to book a flight immediately and then request a refund within 90 days. In reality, Air Canada's policy explicitly stated that the airline will not provide refunds for bereavement travel after the flight is booked. Moffatt dutifully attempted to follow the chatbot's advice and request a refund but was shocked that the request was rejected.

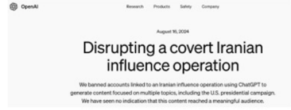
DoNotPay Has To Pay, After FTC Dings It For Lying About Its Non-Existent AI Lawyer

Legal Issues

from the *robot-lawyer-malfunctioned-when-confronted-with-the-ftc* dept
Thu, Sep 26th 2024 12:55pm - **Mike Masnick**

Remember "DoNotPay"? They were the company, run by Joshua Browder, claiming to be the "world's first robot lawyer." There were all sorts of sketchy things going on, some of which dated back to "DoNotPay's" **earliest days**. But things really came to a head last year when legal investigator extraordinaire, Kathryn Tewson, **started digging in** and **finding** an **awful lot** of **questionable** things **going on**.

And there are other social risks to think about



Welcome

- This course focuses on applications of **language models** in **law** and **social science**.

Welcome

- This course focuses on applications of **language models** in **law** and **social science**.
- Engineering goals:
  - Develop skills in applied natural language processing
  - Apply to machine interpretation and generation of natural language texts – e.g. legal and political documents.

Welcome

- This course focuses on applications of **language models** in **law** and **social science**.
- Engineering goals:
  - Develop skills in applied natural language processing
  - Apply to machine interpretation and generation of natural language texts – e.g. legal and political documents.
- Scientific goals:
  - Relate text data to metadata to understand social forces.
  - Understand the motivations and decisions of judges and public officials through their writings and speeches.

Python knowledge is a Course Pre-Requisite

- Course Repo: `https://github.com/elliottash/lm_lss_2025`
  - notebooks have examples; assignments have homeworks.
- Python is ideal for text data and natural language processing.
  - Can use Anaconda, google colab, or download the packages we need to a pip environment.
  - See the syllabus for list of packages we will use – especially sklearn, gensim, spacy, pytorch, and huggingface.
- First TA session video explains how to set things up.

Homework & TA Sessions

- Coding homeworks can be submitted at any time, up until the end of the class
  - Submit IPYNB file to Moodle
  - Completion grade – full credit for trying every question and submitting on time (checked programmatically and by random audit)
  - Have to submit an assignment (even if late) to see example solution.
- TA Sessions (Video Recordings)

In-Class Quizzes/Surveys

- In-class participation is rewarded with credit on in-class surveys and quizzes (completion credit).

Response Essay & In-Class Exam

- Response Essay (`https://eash.cc/NLP-RE`)
  - critically review one of the articles applying NLP methods
  - two drafts; in first one, will get peer feedback.
  - more detail on this later

Response Essay & In-Class Exam

- Response Essay (`https://eash.cc/NLP-RE`)
  - critically review one of the articles applying NLP methods
  - two drafts; in first one, will get peer feedback.
  - more detail on this later
- In-class exam on the last day of class
  - short-answer questions based on the slides.

Video Presentations

- Starting in Week 3, in most lectures we will have at least one in-class presentation given by a student group.
  - each student should contribute to one presentation during the term.
  - 3-4 students per presentation
- Presentation format:
  - summarize the methods and main findings
  - identify at least one problem with the paper, or idea for improvement.
  - 8 minutes max.

Course Workload

3 ECTS credits $\approx$ 90 hours of work

see syllabus for details

What is the endpoint of NLP?

What is the endpoint of NLP?

Machine understanding of text **discourse** across long documents and corpora**.**

- good summaries of long texts: extraction of relevant information, discarding of irrelevant information.
- question answering: retrieving evidence and answers from large corpora

What is the endpoint of NLP?

Machine understanding of text **discourse** across long documents and corpora**.**

- good summaries of long texts: extraction of relevant information, discarding of irrelevant information.
- question answering: retrieving evidence and answers from large corpora
- are we there now?
- what else?

Four modes for NLP

- **Local:** get at linguistic information/relations from local context, e.g. sentences, paragraphs:
  - computing local sentiment
  - textual entailment
  - co-reference resolution
  - closed question answering
- **Long document (covering multiple topics)**: linguistic information from long documents:
  - TF-IDF and CBOW representations $\rightarrow$ supervised learning
  - cosine distance between vectors
- **Global / knowledge base**: corpus level tasks:
  - information retrieval / search
  - open question answering / claim checking
- **Generative/Creative:** generate text for some purpose.
  - compose a sonnet
  - draft a legal brief to attack the opponent's brief

Objectives: Social-Science Research using Text Data

1. **What is the research question?**
2. Corpus and Data:
   - obtain, clean, preprocess, and link.
   - Produce descriptive visuals and statistics on the text and metadata
3. Language modeling:
   - **What are we trying to measure?**
   - Select a model and train it.
   - Probe sensitivity to hyperparameters.
   - Validate that the model is measuring what we want.
4. Empirical analysis
   - Produce statistics or predictions with the trained model.
   - **Answer the research question.**

Text is high-dimensional

- Text data is a sequence of characters called documents.
- The set of documents is the **corpus**, which we will call D.
- sample of documents, each n_L words long, drawn from vocabulary of n_V words.
- The unique representation of each document has dimension $n_V^{n_L}$.
  - e.g., a sample of 30-word Twitter messages using only the one thousand most common words in the English language
    - $\rightarrow$ dimensionality $= 1000^{30} = 10^{32}$

Text data is unstructured

- the information we want is mixed together with (lots of) information we don't.

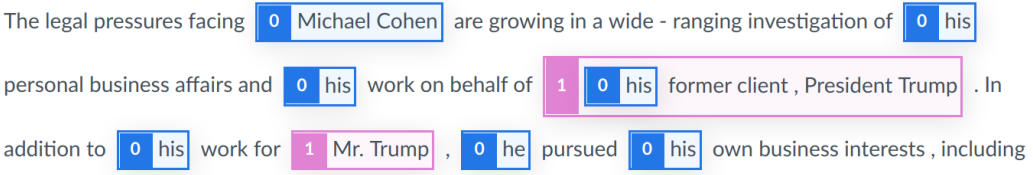
Text data is unstructured

- the information we want is mixed together with (lots of) information we don't.
- All text data approaches will throw away some information:
  - The trick is figuring out how to retain valuable information.

Text data is unstructured

- the information we want is mixed together with (lots of) information we don't.
- All text data approaches will throw away some information:
  - The trick is figuring out how to retain valuable information.
- The tools from Weeks 2 (Tokenization) and 3 (Dimension Reduction) are focused on this step:
  - transforming an unstructured corpus D to a usable matrix X.

Co-Reference Resolution



This course is about relating documents to metadata

- This course is on **applied** NLP:
  - the documents are not that meaningful by themselves.
  - we want to relate **text** data to **meta**data.

This course is about relating documents to metadata

- This course is on **applied** NLP:
  - the documents are not that meaningful by themselves.
  - we want to relate **text** data to **meta**data.
- e.g., measuring positive-negative sentiment Y in judicial opinions.
  - not that meaningful by itself.

This course is about relating documents to metadata

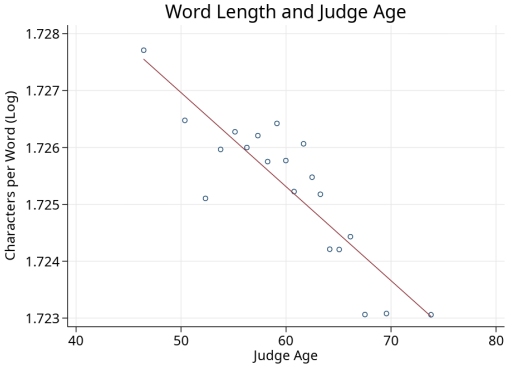
- This course is on **applied** NLP:
  - the documents are not that meaningful by themselves.
  - we want to relate **text** data to **meta**data.
- e.g., measuring positive-negative sentiment Y in judicial opinions.
  - not that meaningful by itself.
- but how about sentiment Y_{ijt} in opinion i by judge j at time t:
  - how does sentiment vary over time t?
  - does judge from party p_j express more negative sentiment toward defendants from group g_i?

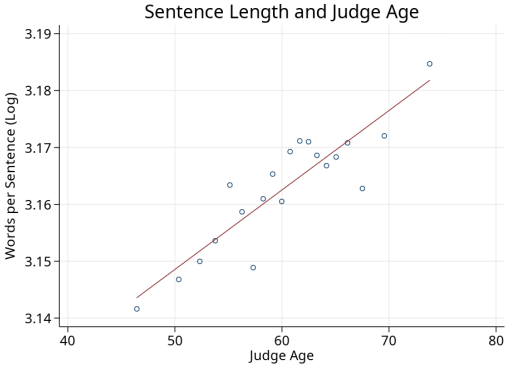
e.g., Judge Age and Writing Style

Ash, Goessmann, and MacLeod (2022)

e.g., Judge Age and Writing Style

Ash, Goessmann, and MacLeod (2022)





What counts as a document?

The unit of analysis (the "document") will vary depending on your question.

- needs to be fine enough to fit the relevant metadata variation
- should not be finer – would make dataset more high-dimensional without relevant empirical variation.

What counts as a document?

The unit of analysis (the "document") will vary depending on your question.

- needs to be fine enough to fit the relevant metadata variation
- should not be finer – would make dataset more high-dimensional without relevant empirical variation.

What should we use as the document in these contexts?

1. predicting whether a judge is right-wing or left-wing in partisan ideology, from their written opinions.
2. predicting whether parliamentary speeches become more emotive in the run-up to an election
3. measuring whether newspapers use higher or lower sentiment toward different groups.

Handling Corpora

- There is already a vast amount of data out there that has already been compiled (e.g. Wikipedia, CourtListener, Google Trends).

Handling Corpora

- There is already a vast amount of data out there that has already been compiled (e.g. Wikipedia, CourtListener, Google Trends).
- This won't be on an assignment but everyone in this class should learn how to:
  1. query REST API's
  2. run a web scraper in selenium
  3. do pre-processing on corpora, e.g. to remove HTML markup, fix errors associated with OCR.
- I also recommend everyone to become familiar with huggingface datasets (`https://huggingface.co/docs/datasets/`)

Handling Corpora

- There is already a vast amount of data out there that has already been compiled (e.g. Wikipedia, CourtListener, Google Trends).

Measuring uncertainty in macroeconomy

Baker, Bloom, and Davis (QJE 2016)

Measuring uncertainty in macroeconomy

Baker, Bloom, and Davis (QJE 2016)

For each newspaper on each day since 1985, submit the following query:

1. Article contains "uncertain" OR "uncertainty", AND
2. Article contains "economic" OR "economy", AND
3. Article contains "congress" OR "deficit" OR "federal reserve" OR "legislation" OR "regulation" OR "white house"

Normalize resulting article counts by total newspaper articles that month.

WordNet

- English word database: 118K nouns, 12K verbs, 22K adjectives, 5K adverbs

The noun "bass" has 8 senses in WordNet.
1. bass[1] - (the lowest part of the musical range)
2. bass[2], bass part[1] - (the lowest part in polyphonic music)
3. bass[3], basso[1] - (an adult male singer with the lowest voice)
4. sea bass[1], bass[4] - (the lean flesh of a saltwater fish of the family Serranidae)
5. freshwater bass[1], bass[5] - (any of various North American freshwater fish with lean flesh (especially of the genus Micropterus))
6. bass[6], bass voice[1], basso[2] - (the lowest adult male singing voice)
7. bass[7] - (the member with the lowest range of a family of musical instruments)
8. bass[8] - (nontechnical name for any of numerous edible marine and freshwater spiny-finned fishes)

Figure 19.1 A portion of the WordNet 3.0 entry for the noun *bass*.

- Synonym sets (synsets) are a group of near-synonyms, plus a gloss (definition).
  - also contains information on antonyms (opposites), holonyms/meronyms (part-whole).
- Nouns are organized in categorical hierarchy (hence "WordNet")
  - "hypernym" – the higher category that a word is a member of.
  - "hyponyms" – members of the category identified by a word.

- LIWC (pronounced "Luke"): Linguistic Inquiry and Word Counts
  - 2300 words in 70 lists of category-relevant words, e.g. "emotion", "cognition", "work", "family", "positive", "negative" etc.
- Mohammad and Turney (2011):
  - code 10,000 words along four emotional dimensions: joy–sadness, anger-fear, trust-disgust, anticipation-surprise
- Warriner et al (2013):
  - code 14,000 words along three emotional dimensions: valence, arousal, dominance.

Dictionary Methods: Identifying Race-Related Research in Economics (1)

RACE-RELATED RESEARCH IN ECONOMICS AND OTHER SOCIAL SCIENCES*

ARUN ADVANI ELLIOTT ASH DAVID CAI IMRAN RASUL†

DECEMBER 2020

Abstract

How does economics compare to other social sciences in its study of race and ethnicity related issues? We assess this question using a corpus of 500,000 academic publications in economics, political science, and sociology. Using an algorithmic approach to classify race-related publications, we document that economics lags far behind the other disciplines in the volume and share of race-related research. Since 1960, there have been 13,000 race-related

Dictionary Methods: Identifying Race-Related Research in Economics (2)

Corpus. We build a corpus of publications for economics, political science, and sociology. The foundation for this corpus is the *JSTOR* database of academic journals (`jstor.org`). We consider all publications in journals that *JSTOR* characterizes as comprising the disciplines of economics, sociology, and political science. Although publication series are available back to the 1880s, our

this rises steadily over time. Our working sample from 1960 to 2020 covers nearly half a million journal publications: 224,855 publications from 231 economics journals, 138,188 publications from 185 sociology journals, and 110,835 publications from 213 political science journals.

Dictionary Methods: Identifying Race-Related Research in Economics (3)

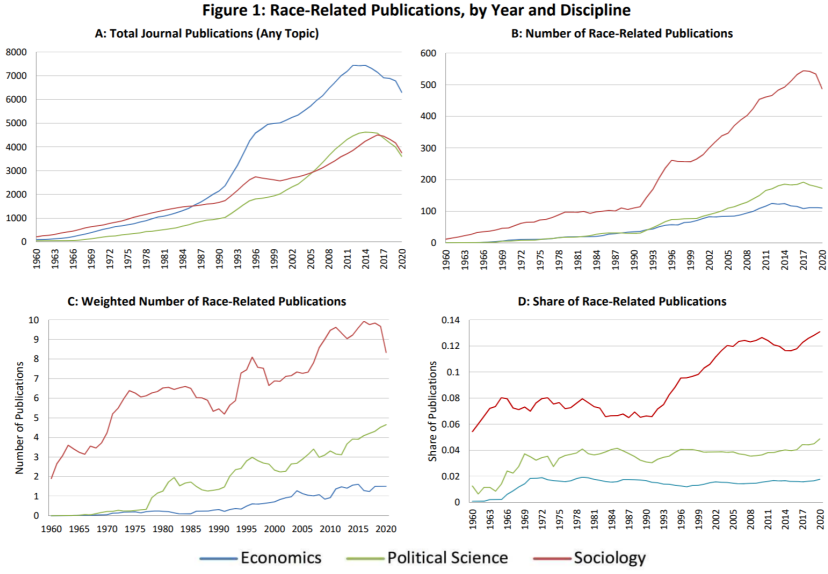
Identifying Race-Related Research. Given the volume of publications considered, it is infeasible to codify race-related research by hand. We thus take an automated approach and use an algorithm to classify race-related publications. We do so using keywords along two dimensions: (i) the racial or ethnic group being studied; and (ii) the issue being studied. Examples of (case-insensitive) keywords along the group dimension are race, african-american, person of color, and ethnicity. Examples of (case-insensitive) issue keywords include discrimination, prejudice, and stereotype.[2]

Our algorithm selects a publication as being race-related if: (i) at least one group keyword is in the title; or, (ii) at least one group keyword and at least one issue keyword are mentioned in the title or abstract. For rule (ii) we drop the last sentence of the abstract to avoid false positives from research that only mentions race parenthetically, say because it is part of some robustness check rather than the primary focus of study.

Specifically, we define three bands of group keywords that gradually expand on the racial or ethnic groups being studied. Band 0 consists of only abstract or generic keywords denoting racial and ethnic groups (e.g. race, ethnic, under represented minority). Band 1 adds group keywords relating to the main minority groups in the U.S. (African American, Latinos and Native Americans). Band 2 adds less salient group keywords (e.g. White, South Asian, Indian American, Japanese American) and other minorities based on religious beliefs (e.g. Muslim, Jewish). The full lexicon of group keywords used by Band are shown in Appendix Table A1.

The lexicon of issue keywords, shown in Appendix Table A2, are held constant and not split into bands. These words and phrases are broadly split across five broader topics: discrimination, inequality, diversity, identity, and historical issues. For example, discrimination includes prejudice and stereotypes, while inequality includes disparity and disadvantage.

Dictionary Methods: Identifying Race-Related Research in Economics (4)



Notes: We use data from JSTOR, Scopus, and the Web of Science to construct the number and shares of race related publications in economics, political science, and sociology. Panel A reports the total number of publications in each discipline. As the publication series start in the 1880s, the publication numbers do not start exactly at zero in 1960, the first year of our working sample. Panel B reports the number of articles that are determined to be race-related by our algorithm. Panel C reports a journal-weighted version of Panel B using the journal quality weights from Angrist et al. [2020]. Panel D reports the share of articles determined to be race-related by our algorithm in each discipline. All series presented are 5-year moving averages.

Sentiment Analysis

Extract a "tone" dimension – positive, negative, neutral

- standard approach is lexicon-based, but they fail easily:
  - e.g., "good" versus "not good" versus "not very good"
  - what if you are analyzing court documents, and "murder" is identified as a negative sentiment term?

Sentiment Analysis

Extract a "tone" dimension – positive, negative, neutral

- standard approach is lexicon-based, but they fail easily:
  - e.g., "good" versus "not good" versus "not very good"
  - what if you are analyzing court documents, and "murder" is identified as a negative sentiment term?
- huggingface model hub has a number of transformer-based sentiment models, based on human annotations.
  - but again, a court document mentioning "murder" will probably get a negative-toned score

Sentiment Analysis

Extract a "tone" dimension – positive, negative, neutral

- standard approach is lexicon-based, but they fail easily:
  - e.g., "good" versus "not good" versus "not very good"
  - what if you are analyzing court documents, and "murder" is identified as a negative sentiment term?
- huggingface model hub has a number of transformer-based sentiment models, based on human annotations.
  - but again, a court document mentioning "murder" will probably get a negative-toned score
- Off-the-shelf scores are corpus specific, eg online writing – may not work for legal text, for example.
  - Hamilton et al (2016) and Zorn and Rice (2019) show how to make domain-specific sentiment lexicons using word embeddings (more on this later).

Problems with Sentiment Analyzers: NLP System Bias

```
text_to_sentiment("Let's go get Italian food")
2.0429166109
text_to_sentiment("Let's go get Chinese food")
1.4094033658
text_to_sentiment("Let's go get Mexican food")
0.3880198556
```

```
text_to_sentiment("My name is Emily")
2.2286179365
text_to_sentiment("My name is Heather")
1.3976291151
text_to_sentiment("My name is Yvette")
0.9846380213
text_to_sentiment("My name is Shaniqua")
-0.4704813178
```

Is this sentiment model racist?

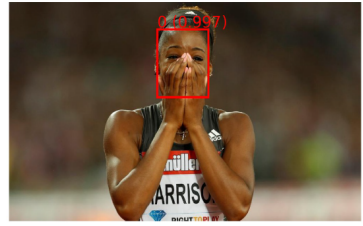
Source: Kareem Carr slides.

NLP "Bias" is statistical bias

- Sentiment scores that are trained on annotated datasets also learn from the correlated non-sentiment information.

Example: Ash, Durante, Grebenschikova, Schwarz (2021) (1)

Classifier for Gender and Ethnicity



Example: Ash, Durante, Grebenschikova, Schwarz (2021) (2)

Table 1: Image Shares and Text Sentiment

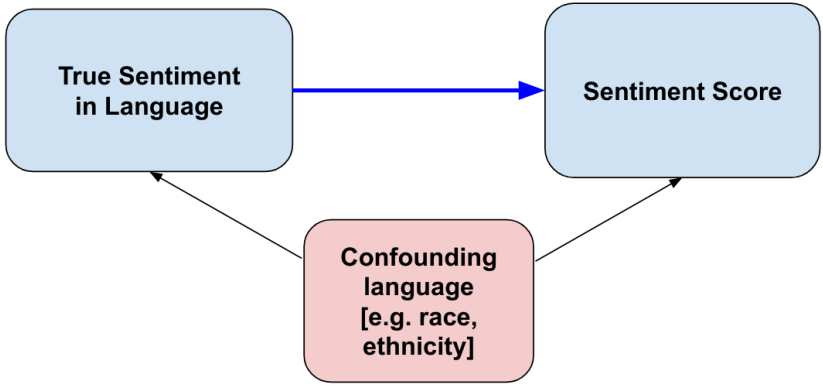
	Dep. Variable: Sentiment of Text				
	(1) Female	(2) White	(3) Black	(4) Asian	(5) Hispanic
Image Share	0.098***	0.063***	-0.072***	-0.015**	0.065***
	(0.004)	(0.004)	(0.005)	(0.007)	(0.007)
FOX × Image Share	0.001	0.055***	-0.062***	0.007	-0.024*
	(0.007)	(0.006)	(0.009)	(0.011)	(0.013)
Outlet × Section FE	Yes	Yes	Yes	Yes	Yes
Month FE	Yes	Yes	Yes	Yes	Yes
outlet	Yes	Yes	Yes	Yes	Yes
Observations	404,861	404,861	404,861	404,861	404,861
Mean of DV	0.34	0.34	0.34	0.34	0.34

NLP "Bias" is statistical bias

- Sentiment scores that are trained on annotated datasets also learn from the correlated non-sentiment information.

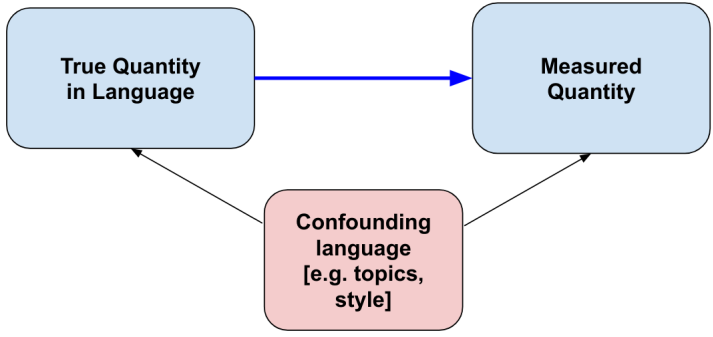
NLP "Bias" is statistical bias

- Sentiment scores that are trained on annotated datasets also learn from the correlated non-sentiment information.

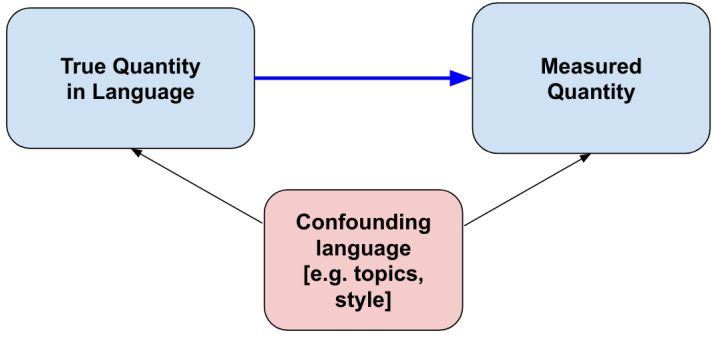


- Supervised sentiment models are confounded by correlated language factors.
  - e.g., in the training set, maybe people complain about Mexican food more often than Italian food because Italian restaurants tend to be more upscale.

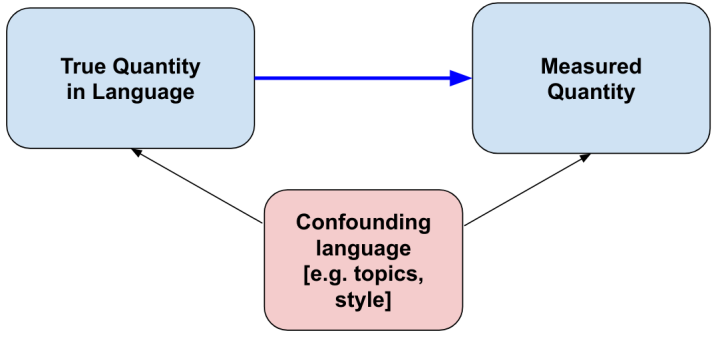
This is a universal problem



- supervised models (classifiers, regressors) learn features that are correlated with the label being annotated.
- unsupervised models (topic models, word embeddings) learn correlations between topics / contexts.



- **dictionary methods**, while having other limitations, mitigate this problem
  - the researcher intentionally "regularizes" out spurious confounders with the targeted language dimension.
  - helps explain why economists often still use dictionary methods.



- **dictionary methods**, while having other limitations, mitigate this problem
  - the researcher intentionally "regularizes" out spurious confounders with the targeted language dimension.
  - helps explain why economists often still use dictionary methods.
- but limitations of dictionaries are severe; we often cannot afford to use them.
  - so we will have to take on the considerable challenge of debiasing NLP models.
